

4 Web Search APIs, Tested Live on 3 Agent Use Cases

You.com, Tavily, Exa and Parallel, compared live on 30 queries: 10 each for GTM, insurance and finance agents, three of the most common use cases for web search APIs.

SUMMARY

Results at a glance

You.com is the fastest search API we tested, and the most dependable at returning something fresh. You.com leads on freshness, reliability and search-only speed. Parallel leads accuracy with You.com a close second and tied with Parallel on fully correct queries.

Overall scorecard — 30 queries, 3 use cases, 4 search APIs

GTM, Insurance and Finance, 10 agent-style search calls each (real-time to 1-year windows). Final run, Oct 8 2026.

Cell colour = rank on that row: best 2nd 3rd worst

	You.com	Tavily	Exa	Parallel
QUALITY				
Accuracy score (% of max, 30 queries × 3 repeats)	63%	51%	53%	67%
Queries fully correct in all 3 repeats	57%	37%	50%	57%
Precision@5 (on-topic share of top 5)	37%	26%	40%	26%
FRESHNESS				
Results dated inside the query's window	59%	37%	44%	29%
Newest relevant result, age (median, hours)	4.1 h	11.9 h	8.2 h	16.6 h
RELIABILITY				
Empty responses (of 90 calls)	0	27	12	3
Failed calls: errors, timeouts (of 90)	0	0	0	0
SPEED				
Latency p50, client (ms)	593	1,864	1,106	2,038
Latency p95, client (ms)	804	3,305	3,997	4,117
Latency p50, server-reported (ms)	379	1,650	831	n/a
COST				
Search cost per correct answer	\$0.026	\$0.016	\$0.012	\$0.008

Each query is written the way an AI agent calls web search: an upstream task, the search call the agent sends, its parameters, and what the agent needs back. Every use case has at least 4 real-time queries; the rest use 24-hour, 48-hour or 7-day windows. Searches run in promptfoo (3 runs per query, client-side timing). Answers were written and graded from each provider's saved results, using the published SimpleQA rubric and FreshQA strict rules.

RECOMMENDATION

My analysis: which provider fits which agent

If your agent...	Pick	Why (from this test)
Answers inside a live turn (voice, chat, alerts)	You.com	fastest at both p50 and p95, freshest results, never returns empty
Does deep research where seconds don't matter	Parallel	highest Finance accuracy; found the release pages and the jobless-claims release that others missed
Needs the most on-topic top 5 for semantic or long-tail queries	Exa	best precision@5 in GTM and Insurance; best Insurance accuracy
Looks up docs or how-to answers	Tavily	best GTM accuracy; correct on the config-docs query

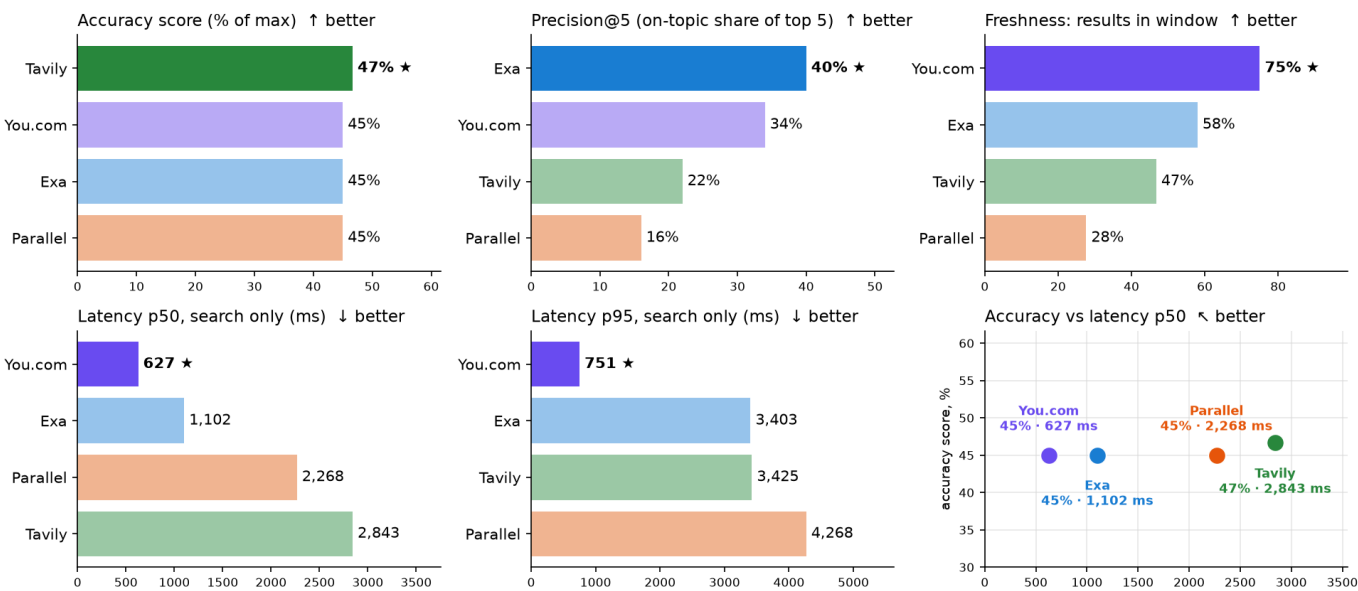

BY USE CASE

Key metrics by all three use cases among all four providers

GTM agent

- 1
- Web search for a developer-signal agent that needs real-time to 7-day signals. Agent job is to find fresh developer and company buying signals for Apache Iggy / streaming infra; output a ranked list of signals with URL, date, who and the pain quoted.

GTM — all providers, ranked best to worst per metric

You.com for real-time signal monitoring; Parallel or Tavily for release and docs lookups.

- You.com is best fit for fresh-signal sweeps an agent re-runs every few minutes. Examples are new mentions of a project, today's funding rounds, and new issues or activity. You.com had the freshest results, no empty responses, low latency, and was the only provider to surface the new Iggy developers activity.

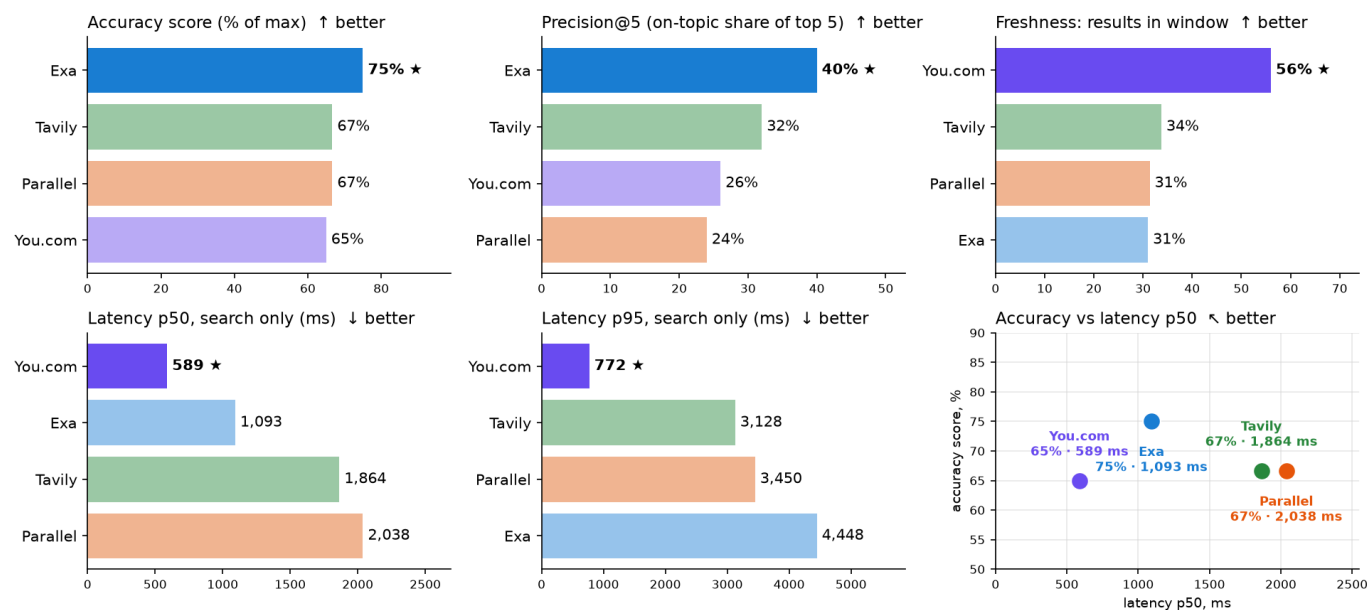

- **Parallel was the only one to find out** lggy release pages and changelog lookups, and Tavily was the only one to find out coding related Config-doc answers.

Insurance agent

2

Web search for a voice and claims agent that must know live catastrophe status mid-call. For example: Liberate-style voice agents for P&C insurers (quote, bind, first notice of loss during a live storm).

Insurance — all providers, ranked best to worst per metric

Bars sorted best → worst; ★ = best. Latency = client wall-clock, search only, run 1 (first time each query sent). Freshness = share of results dated inside the query's window. 10 queries per use case.

You.com for in-call lookups; Exa for background claims checks.

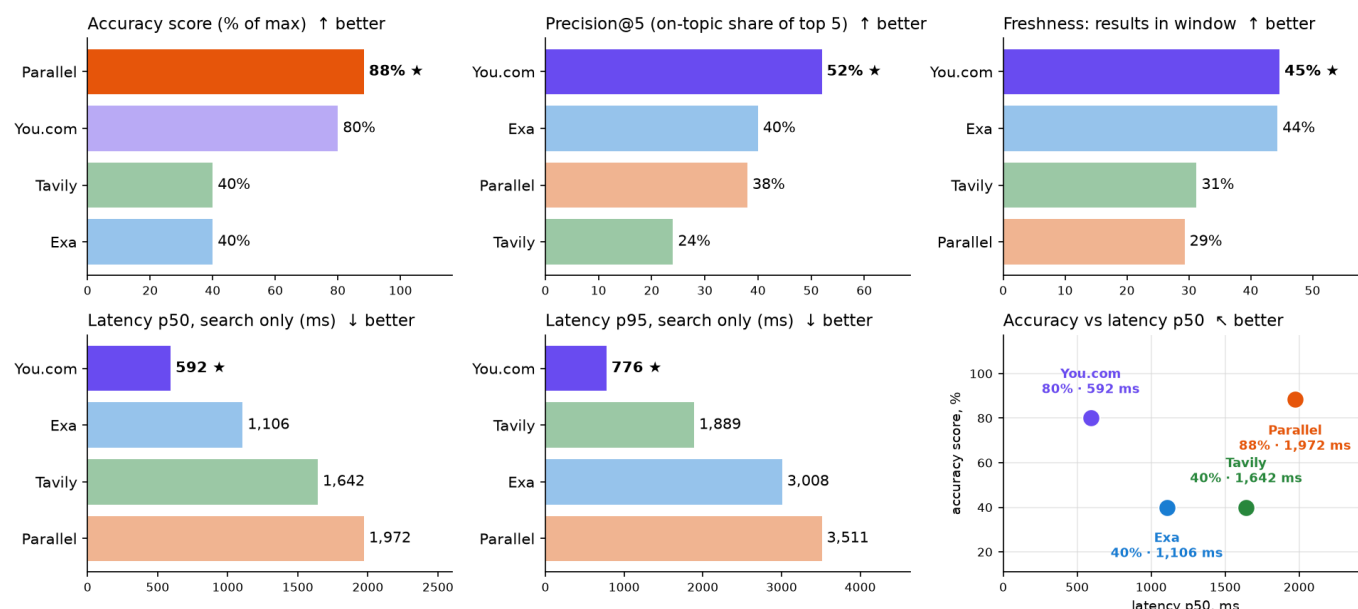

- **You.com is best fit for voice and chat agents that must answer within the caller's turn.** You.com had a lowest latency with every call under 1 s, and the freshest results. It was correct on the live recent advisory verdict, new declaration or new regulations.
- **Exa** was the only provider right on both the county warnings and the live wind speed, where You.com returned a cached weather page. That makes Exa the better fit for claims validation that can take a few seconds if both providers are used together.
- **However,** None of the four found the Underwriting-critical regulator notices such as active Citizens binding suspension that needed a direct government source feed.

Finance agent

3

Web search for an analyst agent that needs exact, current numbers with primary-source citations. It's job is to answer analyst questions with exact, current numbers and a primary-source citation.

Finance — all providers, ranked best to worst per metric

You.com for real-time market Q&A; Parallel for deep research.

- You.com is best fit for analyst copilots answering live market and filing questions.** You.com was right on prices on stocks, the 10-year yield, Bitcoins, current M&A deals, and the JPMorgan timed events. It had the best precision latency, and the freshest results.
- Parallel** was the only provider to find out the un-employment claims on (the weekly count of people newly filing for jobless benefits). It's the pick for batch research or due diligence, where about 2 s per call is fine. Tavily returned nothing on the domain-filtered dol.gov, federalreserve.gov and sec.gov queries.

EVIDENCE

Per query: what was asked, the right answer, and what each API returned

1

GTM agent · per question

What each API returned for the GTM queries

You.com wins when the agent asks what's new. It was the only API to surface today's Apache Iggy activity (G3), and it was also right on this week's funding rounds and agent-memory posts (G8, G9). **Parallel wins when the agent needs the official page**, such as a project's release notes (G4, G6). **Tavily wins on documentation lookups**, such as Kafka's consumer settings (G5). For a GTM agent that watches for fresh buying signals, You.com is the better fit. An agent that mostly looks up release notes or docs is better served by Parallel or Tavily.

GTM — what each API returned, per question

Each cell: the result the answer relied on (else the top result) exactly as returned — domain · published date, then title and its rank. Grey line = grader's verdict.

Colour = accuracy across 3 repeats (search + content run):

correct in all 3 repeats

partly correct, or correct in only some repeats

wrong or missed

Where the true answer is NONE (nothing happened), an empty result counts as correct.

2

Insurance agent · per question

What each API returned for the Insurance queries

You.com returned the latest NHC hurricane advisory (I2), but for current wind speed it returned a cached weather page instead of a live reading (I4). Exa was the only API to get both the live wind speed and both county warnings (I3, I4), which is why it leads Insurance accuracy. No API found the Citizens binding suspension (I1), so an insurance agent still needs a direct check of carrier and regulator pages.

3

Finance agent · per question

What each API returned for the Finance queries

You.com and Parallel are the two APIs that reliably answered live market and filing questions. Both got the NVDA price, the 10-year yield, Bitcoin, the Fed minutes, the Stryker 8-K and the JPMorgan earnings date (F1-F3, F6, F8, F10). Parallel edges ahead because it was the only API to find the right week's jobless-claims report (F5). You.com's one miss on live prices was a WTI oil quote that was four hours old (F4). Tavily and Exa trail at 0.80. Tavily returned nothing on queries limited to government sites (dol.gov, federalreserve.gov, sec.gov), and Exa mostly returned stale prices (F1, F2, F4).

DEVELOPER EXPERIENCE

Setup & friction: summary

Time and steps to activation — sign-in to a copied API key

Left: seconds from sign-in to copying the key (screen recordings). Right: steps in between, i.e. each screen or click the developer must get through (Scribe step count).

Time to activation is the seconds from signing in to copying a working API key, timed from the screen recordings. Steps to activation is the number of screens or clicks a developer must get through in between.

What stands between sign-in and the API key

Green = no friction · amber = a small extra step · red = a gate that blocks the key until completed

	You.com	Tavily	Exa	Parallel
Sign-in How the account is created	Google sign-in, first try	Google sign-in, first try	Google sign-in, first try	Google sign-in, first try
Survey / questionnaire Questions asked before you can reach the key	1 survey: 'How did you hear about us?'	1 use-case screen, skippable	2-question questionnaire: API or MCP? What are you building?	1 survey: 'Where did you hear about Parallel?'
Organization / team setup Must create a company workspace or invite teammates first	None	None	None	Required: name an organization, then a team-invite step
Agent-setup gate Must copy a coding-agent prompt or install a skill before the key can be copied	None	None (agent prompt offered, optional)	Required: copy setup prompt + 'npx skills add' before Copy key unlocks	None
Getting the key Whether a key already exists or you must create it	Create it yourself: API Keys → name → Create → copy (shown once)	Ready on the landing dashboard	Auto-created; copy unlocks last	Auto-created; under Settings → API Keys
Card required Payment card needed to start	No	No	No	No
Free credit at signup What you can spend right away	\$10 usable; \$100 advertised (+\$90 after verifying GitHub or work email)	1,000 credits / month	\$10 on setup screen, \$20 on dashboard	\$20, expires in 60 days
Spend visible in API response Remaining credit or cost per call returned with results	No, dashboard only	No, dashboard only	Yes (costDollars)	Yes (usage field)
First API call Result of the first request with the new key	200 on first try	200 on first try	200 on first try	200 on first try

Where You.com could remove friction (quick wins):

- 1. Show a ready-made default key on the first dashboard view. Tavily, Exa and Parallel all do. This saves about 30 s and brings You.com in line with the fastest.
- 2. Make the advertised credit match what's usable at signup, or move the verification step after the first call.
- 3. Return the remaining credit or the cost per call in the API response, as Exa (costDollars) and Parallel (usage) do. Today it is visible only in the dashboard.

APPENDIX

Details and deep dives

The friction log, how each result was judged, and the full queries, answers and scorecards for GTM, Insurance and Finance are on the web page.
